
Growing the Chip Category: Who Buys, and Whether the New Store Layout Pays Off

Customer Segmentation · Store Trial Evaluation · Rollout Recommendation

Roll out the new layout to Store 77-profile stores — a projected \$605K in incremental annual revenue

Based on 264,836 transactions across 270 stores and a 3-store matched-control trial.

- **Roll out first to stores matching Store 77's profile.**
The only trial store with a statistically significant, sustained uplift (95% confidence) — prioritize locations with strong presence of the two highest-value customer segments.
- **Reorient shelf and promotion toward the two segments that drive revenue.**
Budget Older Families (multi-buy on standard SKUs) and Mainstream Young Singles/Couples (brand variety and large-format packs).
- **Investigate Store 86 before expanding to its profile.**
A real traffic bump faded within a month — the layout may need supporting activation to hold.
- **Deprioritize Store 88-profile stores pending a stronger re-test.**
No detectable effect on sales or traffic.

\$604,738

projected incremental revenue / year
33.0% average uplift, all 270 stores

Two segments drive chip revenue — through customer volume, not bigger baskets

- **Budget Older Families**
#1 in total revenue — frequent, high-volume household buying.
- **Mainstream Young Singles/Couples**
#2 in total revenue but near the bottom in spend per customer — many customers, modest baskets.
- Their revenue lever is foot traffic, not basket size — this matters for the trial result.

The traffic-driven segment reaches for distinctive brands and large-format packs

- **Brand affinity**
Tyrrells, Twisties and Doritos lead — a mix of craft and mainstream, all above the population average.
- **Pack size**
270g+ large formats over-index most (1.23–1.27x); the smallest packs under-index.
- Range and promotion for this segment:
brand variety and big bags — not the 175g default.

Each trial store was measured against a matched control — isolating the layout from normal variation

Store layouts can't be assigned at random — so each trial store is compared with the non-trial store that best matched its pre-trial sales pattern and size (Jul 2018 – Jan 2019).

TRIAL STORE	CONTROL	PRE-TRIAL CORRELATION	
77	233	$r = 0.97$	strong match
86	155	$r = 0.83$	good match
88	201	$r = 0.48$	weakest match — its null result is read with caution

A 95% confidence band, built from each pair's pre-trial variation, defines what “normal” looks like — only movement outside that band counts as a real layout effect.

Store 77 broke above the 95% confidence band in 2 of 3 trial months — and kept climbing

- **Store 77 — confirmed uplift.**

A brief February dip, then +35% (Mar) and +72% (Apr) vs control — both months statistically significant.

- **Store 86 — a spike that faded.**

Significant in March only; back to normal by April.

- **Store 88 — no attributable effect.**

A single February flag traced to an anomalous dip in its control store; traffic and spend never left normal range.

Shaded band = the range explainable by normal variation between each store pair. Only sales outside it indicate a real effect.

The uplift came from more customers walking in — not from bigger baskets

+67%

customer count vs control by April
(Store 77 — independently significant)

~0%

change in transactions per customer
(flat across all three trial months)

This is exactly the lever the segmentation showed matters most: the priority segments already generate revenue through customer volume, not basket size. A traffic-driving layout compounds with the customers who are worth the most.

Generalized across 270 stores, the layout projects ~\$605K in incremental annual revenue

- **Conservative by design.**
The 33.0% average includes Store 77's February dip — not just its best months.
- **Rollout priority.**
1) Store 77-profile stores with high-value segment presence 2) Store 86 profile after investigation 3) Store 88 profile only after a re-test.
- **Before full commitment.**
A 3-store, 3-month trial — validate on a wider store set; excludes rollout cost and seasonality.
